A multi-dimensional criteria algorithm for cloud detection in the circumsolar area

Rogiros Tapakis, Alexandros G. Charalambides,
Macedon D. Moldovan, Bogdan G. Burduhos

June 2015

Presentation Structure

- ▶ Introduction
- ▶ Equipment
- ▶ Methodology
- ▶ Conclusion

- ▶ Computational models for modelling Solar Irradiance
 - Simple empirical models
 - Complicated, integrating various parameters
- ▶ Cloudiness
 - Most profound parameter
 - Presence of clouds obscuring the sun
 - Cloud types – Correlation to irradiance attenuation
 - Possible enhancement of Solar Irradiance due to clouds
- ▶ Cloud Coverage
 - Additional parameter for cloudy models

► Direct Normal Irradiance

- Circumsolar area around 2.5° around the sun
- Influenced by clouds only inside this area
- Cloud coverage not always a representative parameter

Current Research

Sky images targeting the sun

Cloud detection using image processing techniques

Detect clouds inside the circumsolar area

Presentation Structure

- ▶ Introduction
- ▶ **Equipment**
- ▶ Methodology
- ▶ Conclusion

- ▶ **Meteorological Station**
 - Direct, Diffuse, Global Radiation
 - Wind, temperature, humidity
 - EKO sensors
- ▶ **DeltaT BF-5 Sunshine sensor**
 - Diffuse and Global irradiance
- ▶ **Photovoltaics**
 - 150kWp, Several 3kWp
- ▶ **Cameras**
 - Orion All Sky II
 - CMS CloudCam II
 - Go Pro cameras

► Site

- Larnaka, Cyprus (34.92°N, 33.63°E)
- Urban Environment

► CMS CloudCam II

- 1600x1200 pixel (~2MP)
- 180° FOV
- 1 image every 24 sec
- Colour digital camera, JPEG mages
- Sunscreen for protection from thermal heating effects
- Pictures with standard exposure and under exposure time

Normal Exposure

Under Exposure

Presentation Structure

- ▶ Introduction
- ▶ Equipment
- ▶ Methodology
- ▶ Conclusion

- ▶ Invert images
 - East-West direction
- ▶ Sun Position
 - Based on location and time/date
- ▶ Zenith angle
 - Limited to $66^\circ \rightarrow$ Field Of View = 134°
- ▶ Fisheye Projection
 - Pixel per pixel – Fisheye lens pixel to image plane
 - Dependent of zenith angle
- ▶ Horizon
 - Remove nearby buildings

Methodology

RGB space – HSV space

- ▶ NE and UE Images are split to RGB components
 - Red – Green – Blue
- ▶ NE and UE Images are split to HSV space
 - Hue: degree of similarity of a color compared to the unique spectrum colors
 - Saturation: the color purity (the colorfulness of a color relative to its own brightness)
 - Value: the value of brightness (black is zero)
- ▶ Values of each component are used for further calculations

- ▶ Pixel to Pixel calculations for NE and UE images

$$RB_{i,j} = Red_{i,j} - Blue_{i,j}$$

$$GB_{i,j} = Green_{i,j} - Blue_{i,j}$$

$$RBRB_{i,j} = \frac{Red_{i,j} - Blue_{i,j}}{Red_{i,j} + Blue_{i,j}}$$

$$RBV_{i,j} = \frac{Red_{i,j} - Blue_{i,j}}{Value_{i,j}}$$

Image is separated into two regions

1. Around the sun

- Four concentric circles defining the circumsolar area
 - Outer circle covers the blur of the Hue component in NE image
 - Inner circle covers the blur of the Hue component in UE image
 - Two additional intermediate sub regions. Required due to varied brightness around the sun
- Centre of image is the centre of the sun

2. Away from the sun

- The rest of the image
- Horizon

▶ Pixels are categorised

- Sun – Cloud – Sky – Horizon

▶ Different thresholds for each region

• Sun

- Hue UE
- Hue NE
- RBV UE

• Sky

- Hue UE
- Hue NE
- RBRB UE
- RBV UE
- RB NE
- RB UE
- GB NE

• Cloud

- Hue UE
- Hue NE
- RBRB UE
- RBV UE
- RB NE
- RB UE
- GB NE

- ▶ Star shaped saturated region inside the circles
 - Cloudy pixels in ROI
 - Cloudy pixels in rotated ROI
 - Comparison of two numbers
- ▶ Implementation of Gaussian convolution filter
 - Filter on processed image
 - State of neighbouring pixels
 - Comparison of filtered and non-filtered processed image
 - Eliminate errors
 - Especially for individual pixels incorrectly identified as sun

Presentation Structure

- ▶ Introduction
- ▶ Equipment
- ▶ Methodology
- ▶ Conclusion

Conclusions

▶ Outcomes of the study

- A methodology for the classification of pixels inside the circumsolar area
- Normal Exposed and Under Exposed images were used
- Variable threshold based on distance from the sun

▶ Future Work

- Variable image brightness
- Correlation to solar irradiance
- Cloud motion vectors

Acknowledgement

PROGNOSIS PROJECT

This research is supported by the project Effect of Clouds on Solar Irradiance (ECSOL-PROGNOSIS), developed within the Bilateral Cooperations program, with the support of the Romanian Executive Agency for Higher Education, Research, Development and Innovation Funding (CNCS-UEFISCDI) (grant no. 765 / 30.04.2014) and Research Promotion Foundation (RPF) of Cyprus (grant no. 0713 / 09)
