Principles of InSAR

InSAR: Interferometric Synthetic Aperture Radar

- The radar is an active system, transmitting a radio wave from a satellite antenna and receiving a reflected wave from a target.
- Radar observations can be made ***day and night*** as they don't rely on sunlight to operate and under any weather conditions.

Principles of InSAR

- The basic measurements made by SAR are the *amplitude* and the *phase* of the reflected wave.

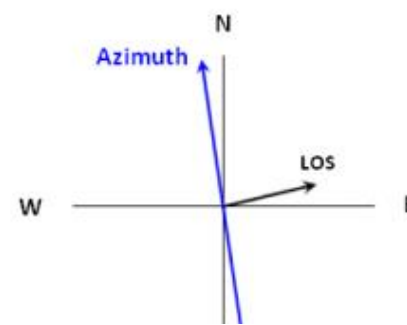

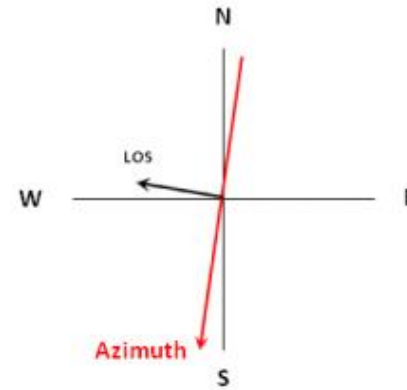

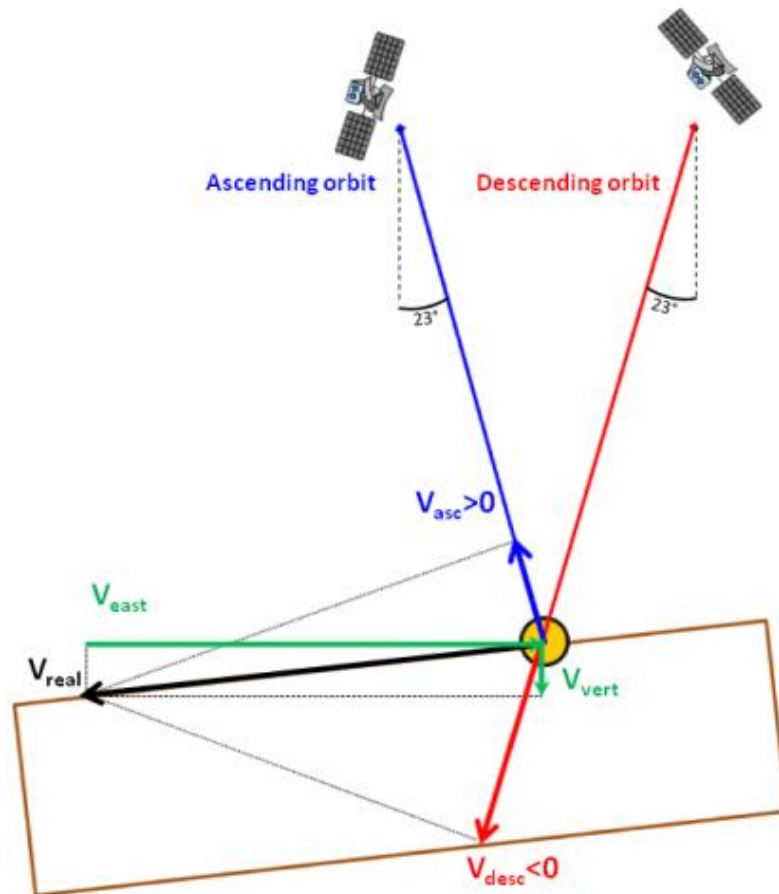

What do we measure?

- We use phase difference to measure displacement.

What do we measure?

- Resolve ascending and descending geometries

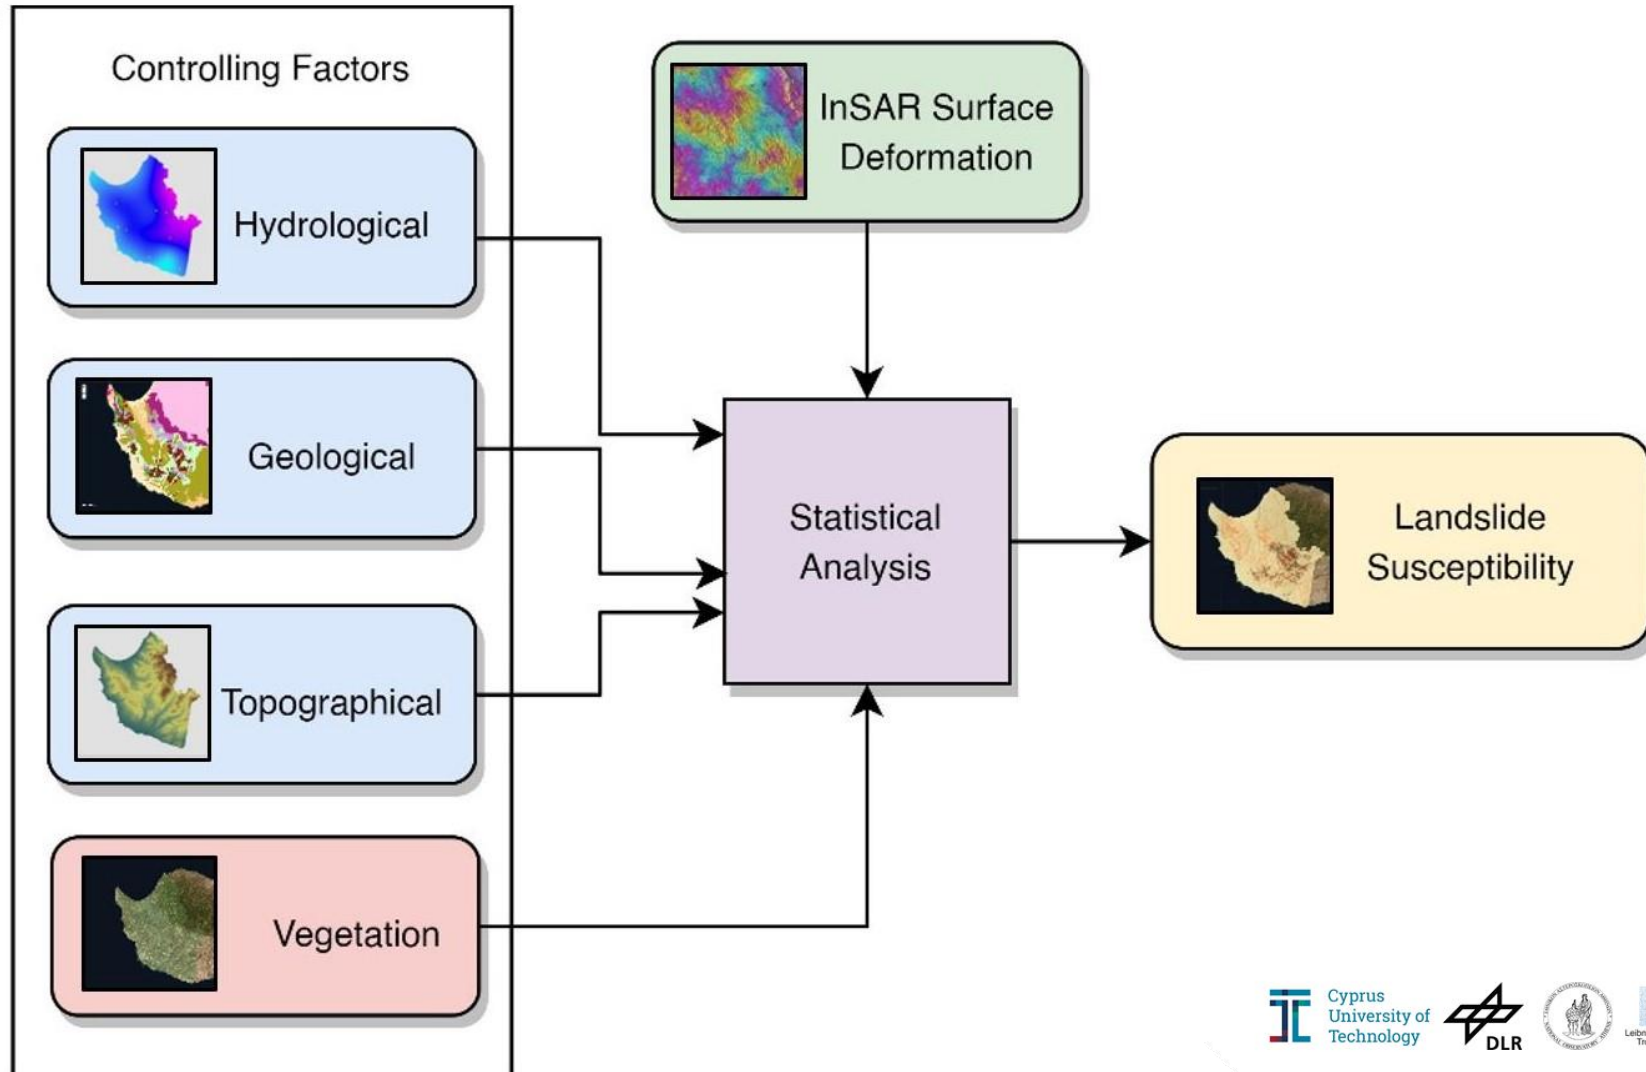

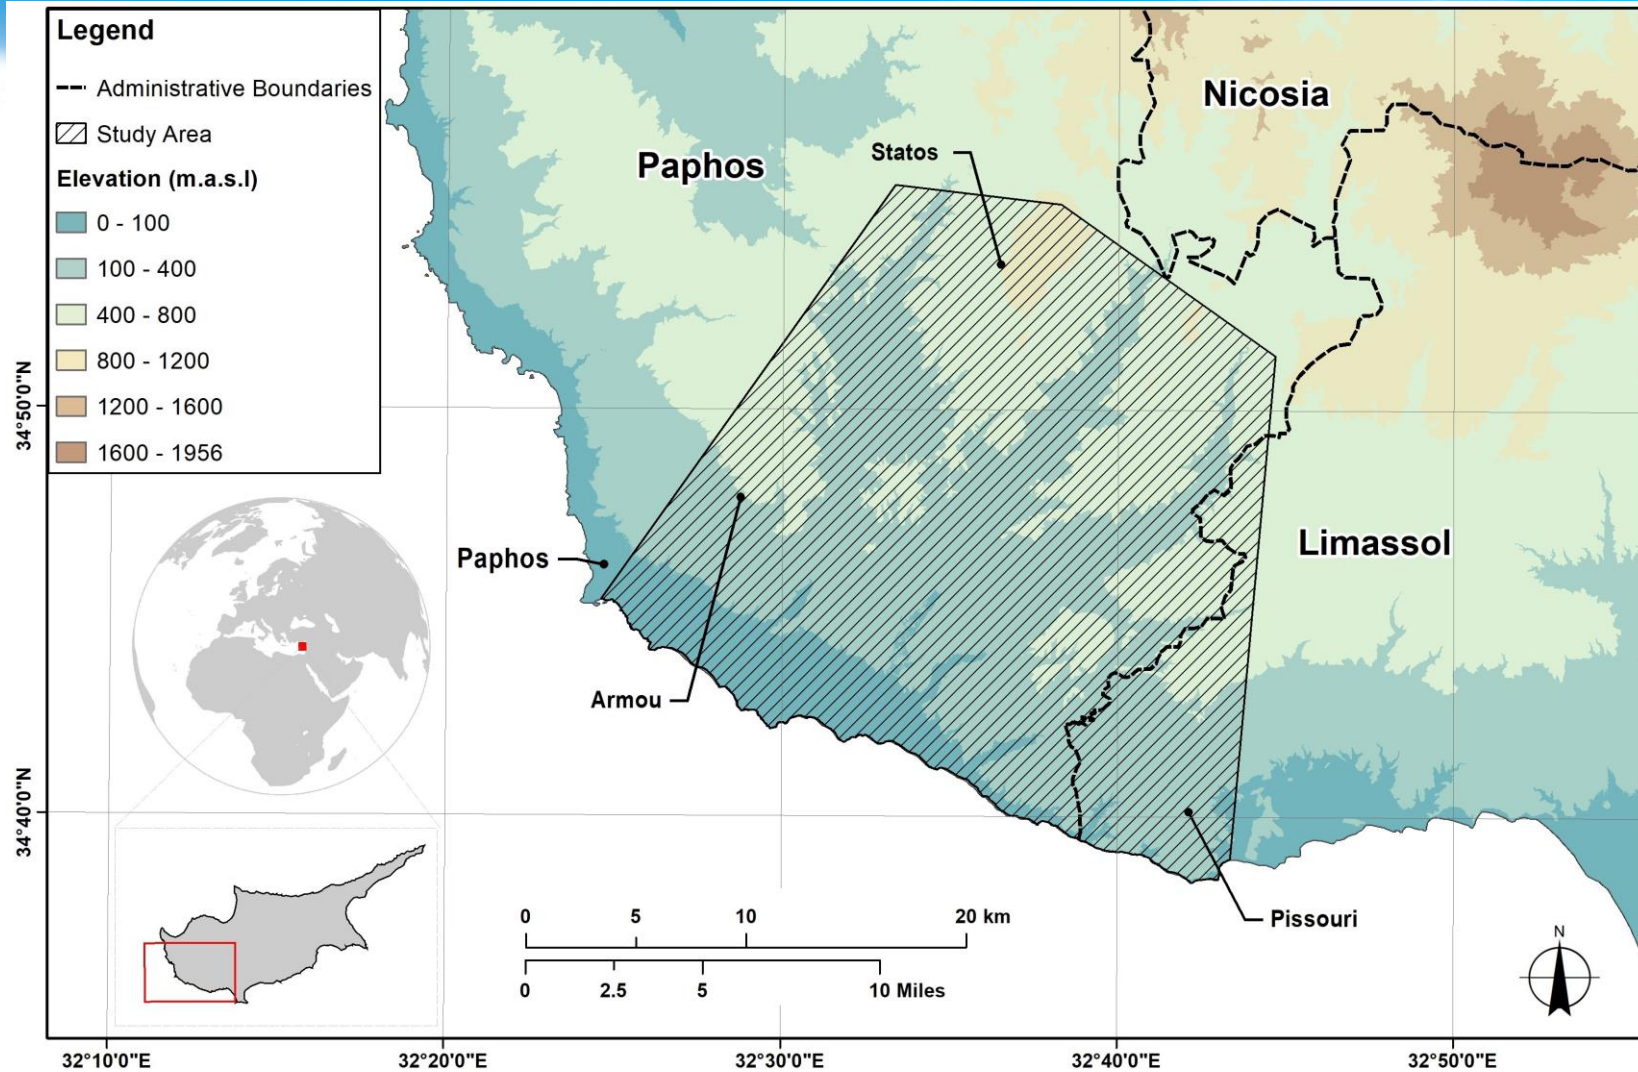

Landslides

- *The majority of losses due to landslides can be avoided if the problem is recognised prior to each landslide event.*
- A study in 2010 in the Paphos district by the Cyprus Geological Survey Department (GSD) and Scott Wilson Ltd, documented **1842 landslides** extending over **134km²** (Hart and Hearn, 2013).

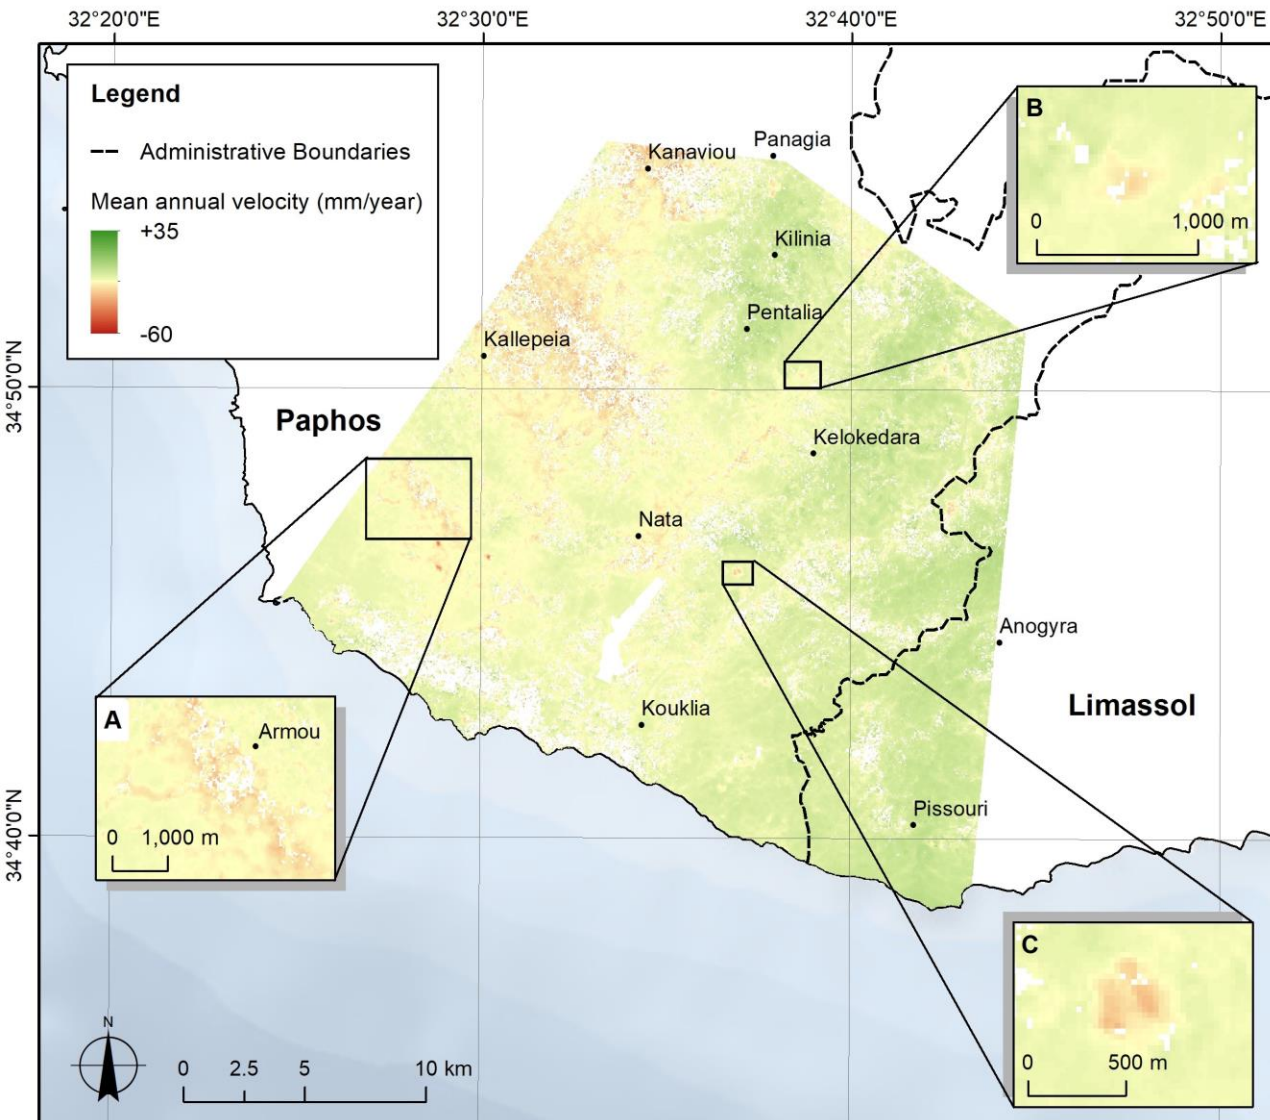

Methodology

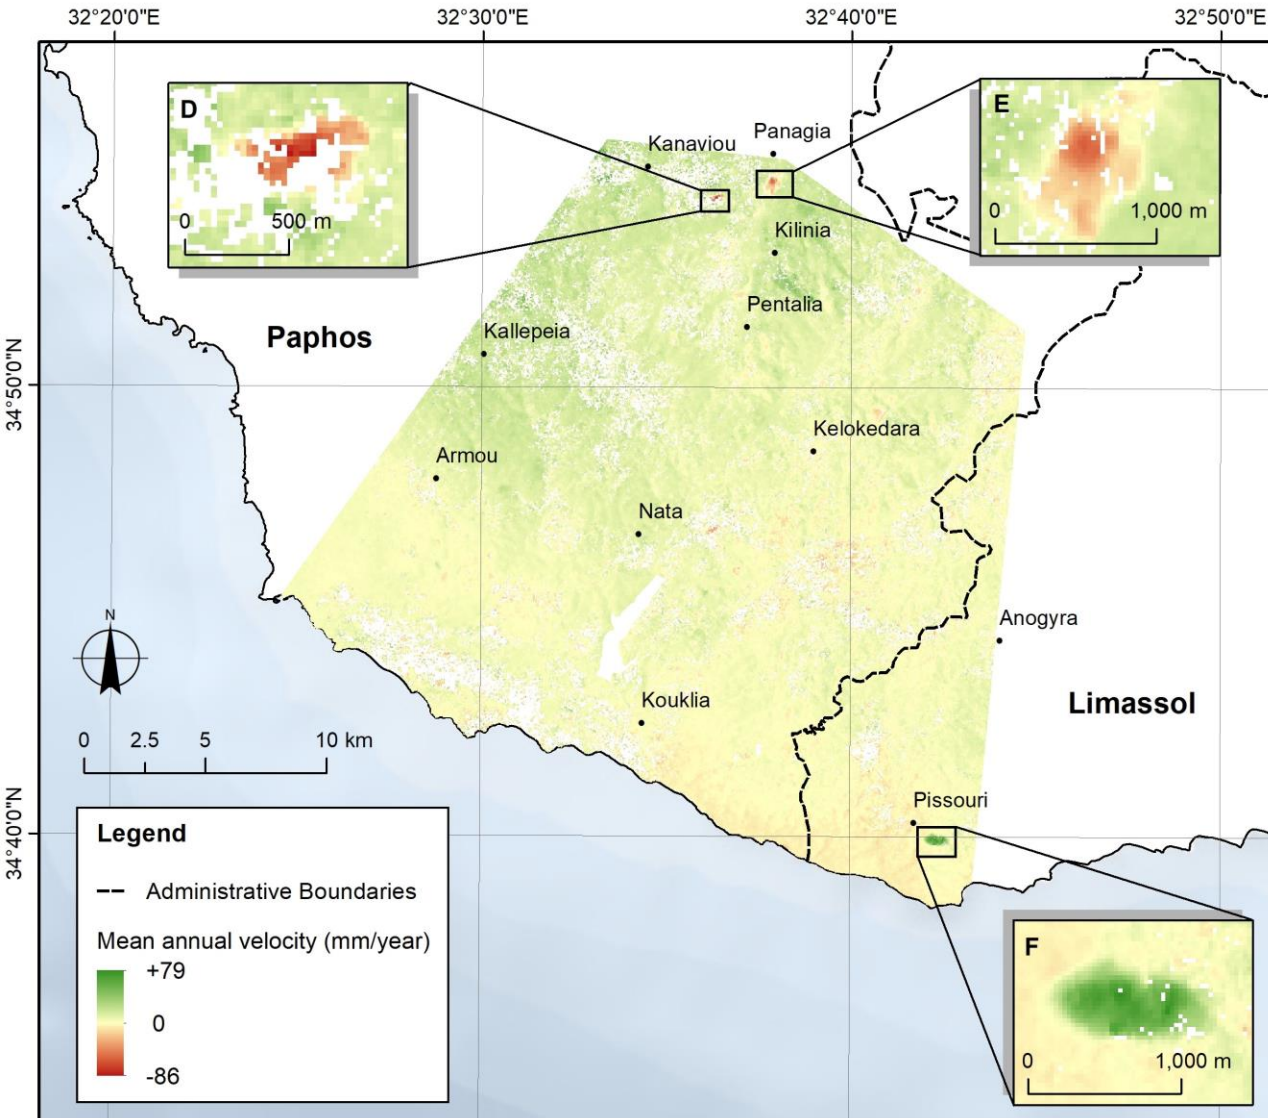

Methodology

- ***Analysis: PS & SBAS***
 - *PS: urban areas, linear movements*
 - *SBAS: sparsely vegetated areas, non-linear movements (seasonal changes)*
- ***Sentinel-1 images: march 2016 – March 2018***
- ***Ascending and Descending geometries***

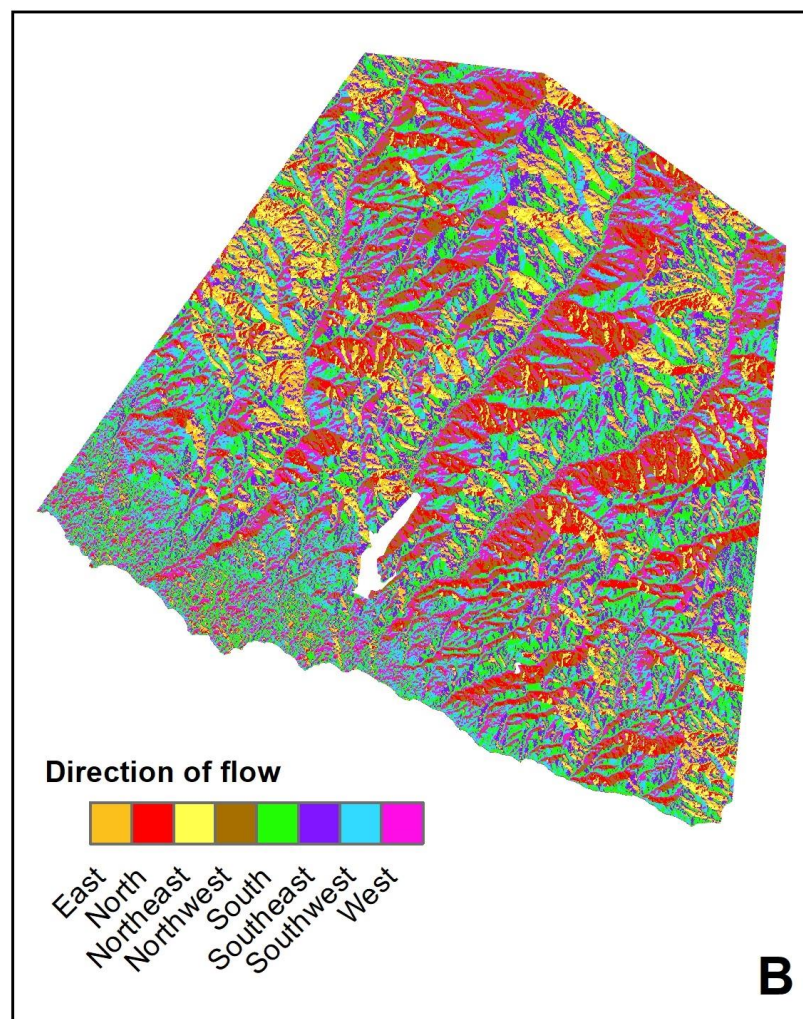

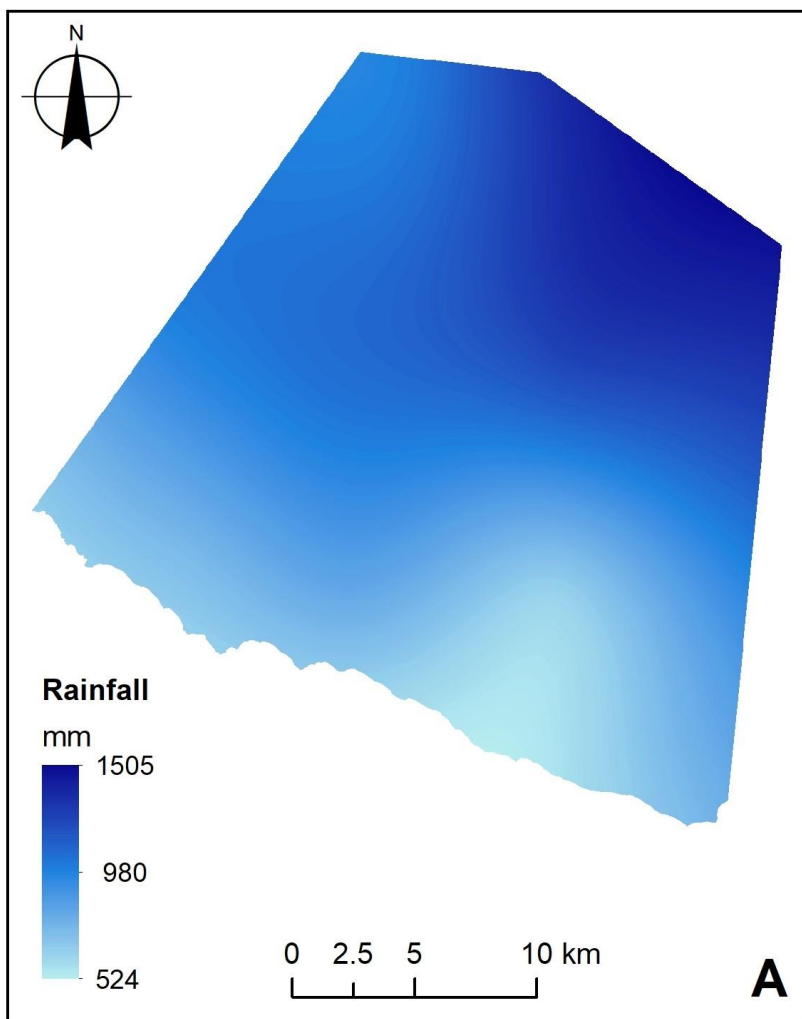

Mean annual *vertical* velocity: mm/year

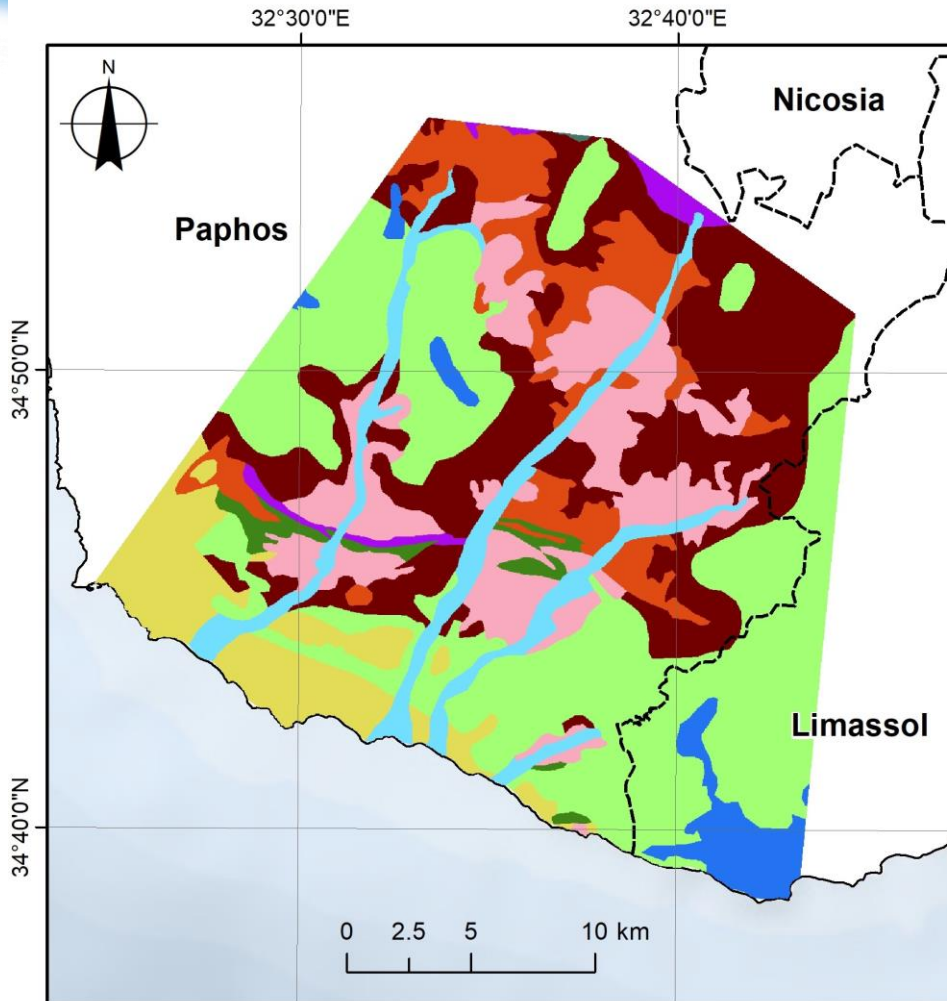

Mean annual *horizontal* velocity: mm/year

Controlling factors

Controlling factors

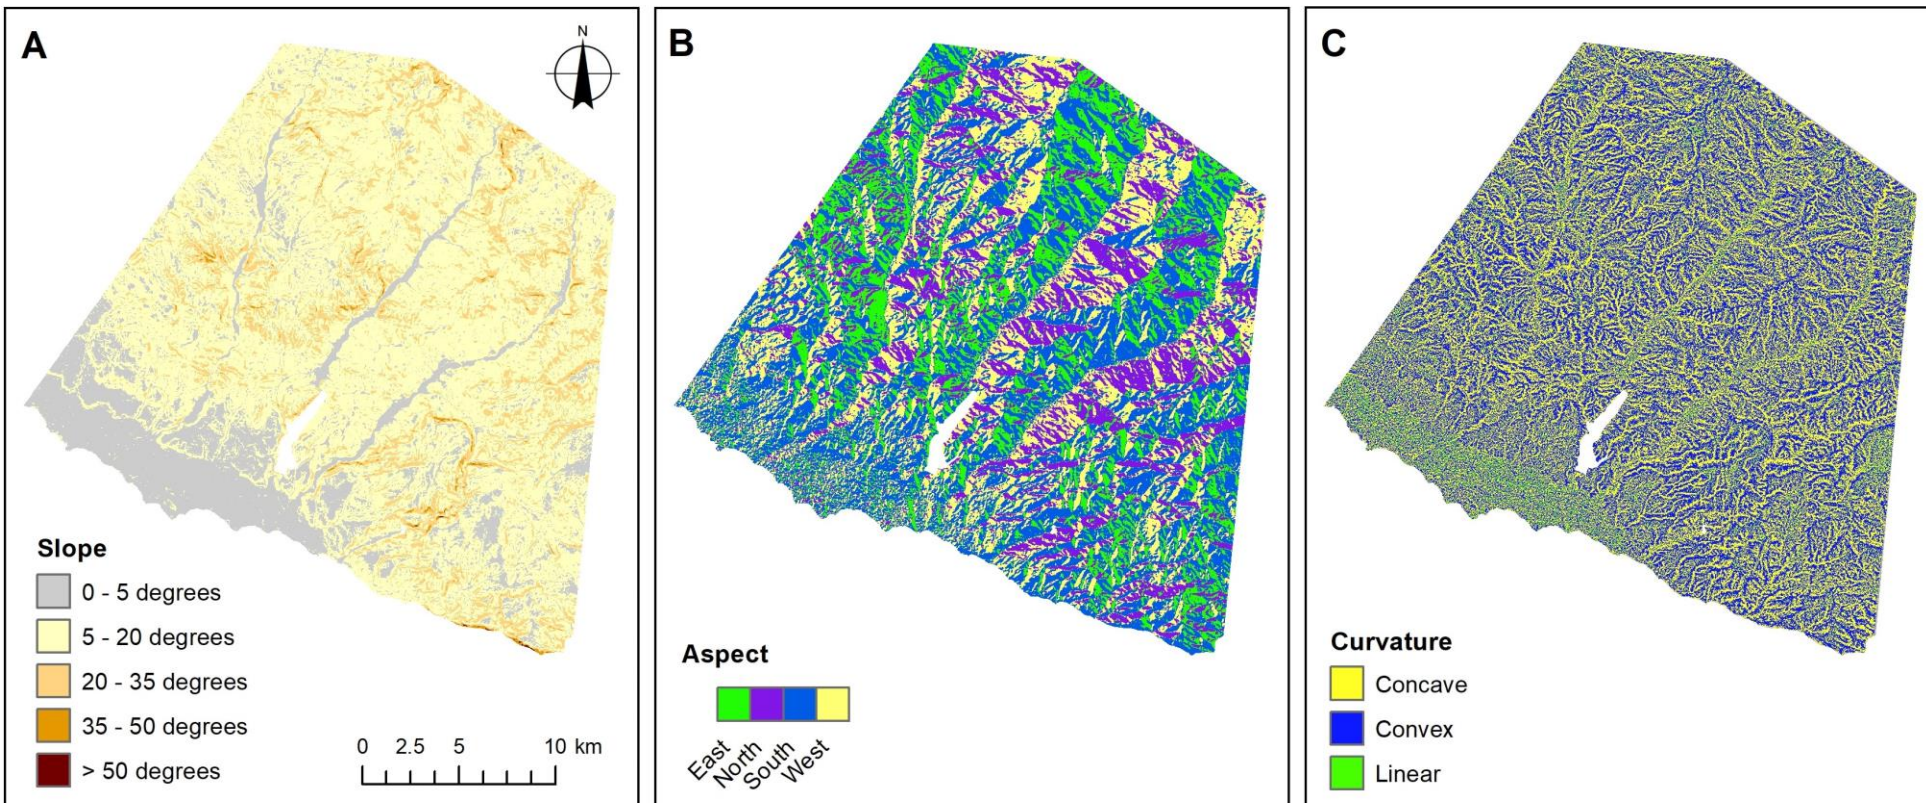

Legend

--- Administrative Boundaries

Geology

- Sheeted Dykes (Diabase)
- Upper and Lower Pillow Lavas and Basal Group
- Alluvium - Colluvium
- Moni, Kannaviou and Pera Pedi Formations - Bentonitic
- Apalos, Athalassa, Kakkaristra and Nicosia Formations
- Kalavaso and Pachna Formations
- Terrace Deposits, Fanglomerate
- Lefkara, Kalogrea-Ardana and Lapithos Formations
- Mamonia Complex
- Harzburgite and Serpentinite

Controlling factors

Susceptibility mapping

Landslide Susceptibility

■ No susceptibility
 ■ Low
 ■ Moderate
 ■ High

M Mapped Landslides

*Statistical analysis:
Weight of Evidence
analysis*

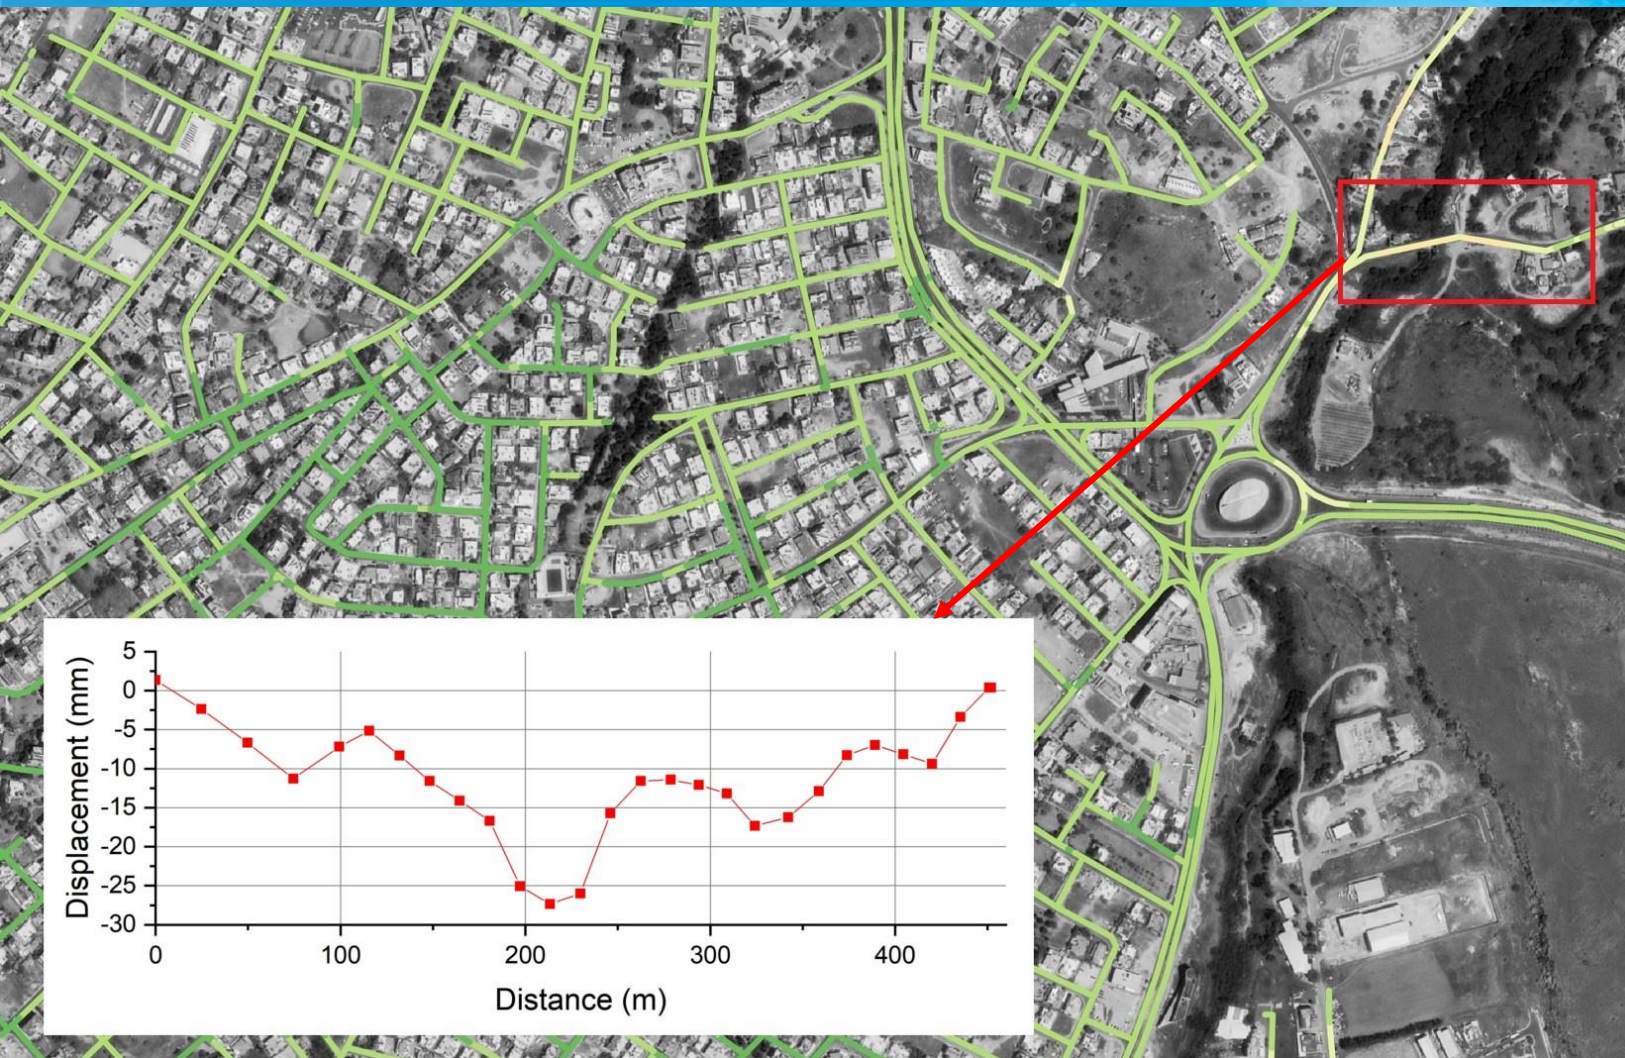

*79.6% success rate &
78.9% prediction rate*
