The approval of the Postgraduate Dissertation from the Language Centre of Cyprus University of Technology does not necessarily imply acceptance of the author's views on behalf of the Department.

I would like to express my heartfelt gratitude to my supervisors, Dr. Antigoni Parmaxi and Dr. Anna Nicolaou. From the time I started this dissertation, you have been nothing but helpful and supportive to my work. Without your guidance, support and patience, my dissertation here would not have been the same. I would like to thank the committee member, Dr. Androulla Athanasiou.

I would like to thank all students from Brazil and North Macedonia who actively participated in the experiments. Without their participation, this study would not be possible to complete.

Summary

The *ba*-construction is a unique but frequently used grammatical construction in the Chinese language. Understanding and using the *ba*-construction precisely and appropriately are the major hurdle of the grammatical difficulties to Chinese Foreign Language (CFL) learners. In face-to-face learning contexts, CFL teachers are inclined to use the Total Physical Response (TPR) method to help students understand the “disposing” nature of the *ba*-construction. Given pandemic lockdowns and the development of educational technology, formal CFL instructions have partly integrated online components or shifted toward online learning contexts. Challenges are provoked when traditional Chinese grammar instructions are constrained by geographic locations and limited resources. This study seeks to address the gap in the literature by examining whether Augmented Reality (AR) technology can facilitate online instructions of the Chinese *ba*-construction through its unique affordance. Furthermore, the study seeks to determine if CFL learners are more engaged in the AR-aided online instructions than others without the AR treatment. In this study, a between-groups quasi-experiment was designed involving 12 adult CFL learners. The experiment was administered in three instruction sessions for two weeks. Same grammatical assessments and engagement surveys were assigned to the AR group and the non-AR group after each instruction. The results indicated a statistically significant difference in favour of the AR group related to learners’ explicit grammatical knowledge and pragmatic knowledge. The use of AR has enhanced participants’ cognitive engagement. Although preliminary, this study can shed light on the design of AR-aided communicative instruction for CFL educators and AR-assisted language learning researchers.
