

Supplementary Material, Michael et al., "Influence of spray technology and application rate on leaf deposit and ground losses in mountain viticulture "

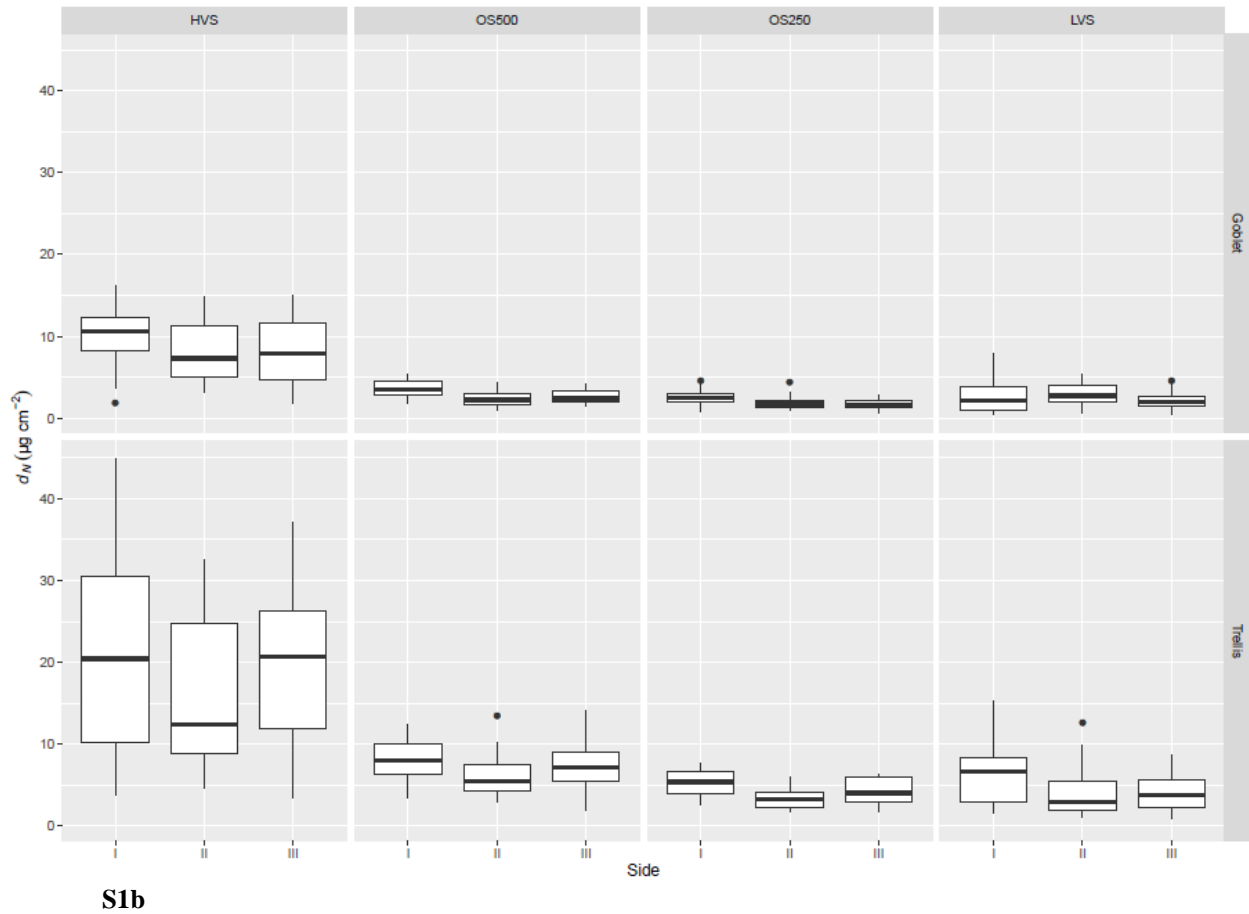

Figure S1: Normalized deposition (d_N) on (a) different heights of vines (A - lower – see Fig. 3 for details) and (b) different sides (II - interior part of the vine) for the goblet and the trellis training systems. Boxplots show the median for each treatment, box boundaries show the 25th and 50th percentile, while whiskers extend to 1.5 times the interquartile range (IQR). Points beyond 1.5 times the IQR are plotted individually. See text for results of statistical analyses.
